

TPD surge suppressor, dissipates and removes harmful transient voltages traveling on data and signal lines reducing lockups, glitches, reprogramming issues and damage.

Rebooting, reprogramming and replacing processors, circuit boards and components can be a never-ending battle. **Problems** in the system are as simple as occasional glitches locking up or turning on and off equipment without user input to **wide spread damage during a severe lightning storm.** TPD-SLP series eliminates damaging pulses traveling in on low voltage pathways protecting automation systems, pool controls, distributed audio, sensors etc. These pulses of energy are distributed throughout the system if left unprotected. The problems will vary depending upon the size and frequency of these pulses. As microprocessors try to function, these transient pulses of energy will cause lock-ups where data can become lost or corrupted. **Larger pulses will cause catastrophic failure while smaller pulses degrade the life and reliability of these systems and controls.**
